

GridMonitor™

Enterprises rely upon the OSIsoft PI System, the industry standard in enterprise historians, to safeguard data and deliver enterprise-wide visibility into operational health. Enterprises trust Augusta Systems technologies to power intelligent convergence of devices, systems, and networks. Now, enterprises that utilize the OSIsoft PI System can harness the combined power of OSIsoft and Augusta Systems technologies together in one product – GridMonitor.

GridMonitor combines EdgeFrontier® Appliance with OSIsoft ECHO and an ECHO to PI Interface as embedded software. As a result of GridMonitor, PI System users -- including energy companies, utilities, and others -- can expand the reach of the PI System to include data from remote devices, systems, and networks.

GridMonitor leverages the power of EdgeFrontier. EdgeFrontier provides a configurable technology platform for building and managing complex monitoring, control, and automation solutions. EdgeFrontier Appliance is a network appliance pre-installed with EdgeFrontier, providing a complete software and hardware platform for intelligent convergence solutions requiring remote network access and distributed processing capabilities. EdgeFrontier Appliance is the right choice for enterprises and integrators that need an easily configurable convergence platform, but lack the computing systems and network infrastructure required for an EdgeFrontier deployment.
